FULTON FUEL-FIRED VERTICAL TUBELESS BOILERS

FULTON: AN INDUSTRY LEADER SINCE 1949

Since Fulton's invention of the vertical tubeless boiler in 1949, Fulton has been the leading U.S. manufacturer of this type of boiler. For over 60 years, more than 100,000 boilers have been produced and distributed world-wide.

Every Fulton boiler is built and stamped to ASME Code and registered with the National Board of Boiler and Pressure Vessel Inspectors. Fulton boilers are UL listed boilers – not just the burner or electrical components – the entire boiler and they are CSA approved.

A vertical tubeless boiler is a relatively simple design, offering years of trouble-free operation

Many Fulton boilers over 30 years of age are still in operation today. There are no tubes or coils to rust or burn out periodically, therefore, no retubing costs, no downtime. No downtime means increased productivity.

Complete control panel box houses all necessary operating components

The 7800 Series Microprocessor based controls are standard. A trouble shooting display module is optional. Fulton's commitment to continuous product improvement is reflected in the efficiency, quality, and ruggedness of these superior standard fuel-fired boilers.

All Fulton Boilers can be ordered with a polished stainless steel jacket

Ask your Fulton distributor how little extra it can cost for stainless.

Unique features begin with simplicity

The furnace (pressure vessel) is, simply stated, a "pipe within a pipe". The top mounted Fulton power burner sends a spinning cyclonic flame into and down the center furnace chamber.

If you want more efficiency with the same vertical tubeless design Fulton has The EDGE

The thickness of the pressure vessel is no less than 5/16" (7.94mm)

and it does have the edge over the Classic. Fuel to steam efficiencies in the low 80's. The EDGE has the same time proven top mounted matched burner with the downward cyclonic flame and features the Fulton engineered Flue Gas Enhancing System (FGE). A highly efficient two pass design, the Fulton FGE system works by using a massive heat transfer surface with high velocity flue gasses traveling over a cylindrical grid of heat convection fins. Through controlled velocities these fins transmit additional heat evenly to the outer side of the water vessel, creating high efficiencies with lower stack temperatures.

Dramatic stack temp. reductions

With the Fulton FB-F, The EDGE, stack temperatures can be from 100-150°F below standard two pass designs and have cut previous fuel bills in half!

A LOOK INSIDE FULTON'S VERTICAL TUBELESS BOILER

The Fulton standard top fired power burner

The optional Fulton low emissions burner.
($< 20\text{PPM NO}_x$ and $< 60\text{PPM CO}$)

Fulton fuel-fired boilers can be ordered with combination fuel capabilities or be converted to combination fuels simply and economically.

All fuel-fired boilers feature the Fulton designed and manufactured top mounted down fired forced draft burner.

THE COMBUSTION PROCESS

1 Air is drawn into the power burner where it is mixed with fuel for optimum combustion. **2** The ignition assembly ignites the air/fuel mixture and sends a spinning cyclonic flame down the length of the furnace chamber, forming the first pass. **3** Flame retainer rings increase occupancy time of the flue gases increasing heat transfer. **4** The flue gases are turned at the base of the chamber and return over the heat convection fins that surround the entire water jacket. This is the second pass, which transfers additional heat to the water in the vessel. The Edge model has more fins and an enhanced orientation to improve heat transfer. **5** The flue gases are then collected at the upper portion of the boiler and are expelled through the flue outlet.

Specifications and Dimensions are approximate. We reserve the right to change specifications and/or dimensions without notice. Diagram for guidance purposes only. Comprehensive details of dimensions, connections, etc. for each model are given on product dimension data sheets available from Fulton.

Note: High pressure boilers ordered with an extra pressure control for night heating have less than rated output while operating at low pressure.

Boiler, Condensate Tank, and Blow-Down Separator

Condensate return tank should be vented and have a capacity sufficient to satisfy boiler consumption and maintain proper return tank temperature. Vent pipe should not be down-sized (may cause pressure build up in the condensate tank). Return pipes must not be insulated.

See Return System Instruction Manual.

Optional barometric damper is recommended for most installations.

HORIZONTAL CONDENSATE RETURN SYSTEMS

FEATURES

Fulton condensate return systems are completely assembled with tank, stand, high pressure pump, motor strainer float valve, shut-off valve, gauge glass assembly, with overflow and drain openings.

- Heavy gauge properly sized tanks built for quick installation and removal or replacement
- Heavy duty feed water pump
- Rigid welded support frame

Designed For All Boilers From 1 HP up to 400 HP

VERTICAL CONDENSATE RETURN SYSTEMS

FEATURES

Both the horizontal and the vertical condensate return systems are available in heavy gauge "long lasting" steel only. Vertical tanks have all the same assembly components that the horizontal tanks do.

- Increased pump life under normal operation because of higher head pressure
- Vertical return systems can be ordered separately or skid-mounted and piped to your boiler
- Easily serviced from the top
- Complete float assembly can be removed without draining tank

Standard pump is good for 180°F maximum water temperature. Pumps for higher temperature water are available upon request.

Vertical Condensate Return Systems Designed For Compact Space Saving Applications For Boilers From 1 HP up to 100 HP

BLOW-DOWN SEPARATORS

FEATURES

Constructed with the finest quality materials, all compact Fulton Blow-Down Separators meet or exceed ASME Code and include special features to insure safe boiler blow-down. Fulton Blow-Down Separators also operate with minimum maintenance.

- Baffle plate absorbs steam flash and pressure
- Steam is expelled safely through vent
- Water and sludge pass through drain to sewer
- 3" x 4" handhole for cleaning and inspection
- Welded to ASME Pressure Vessel Code
- Fast, easy hook-up to boiler

Fulton's full line of heat transfer products includes:

- Fuel-fired vertical tubeless steam and hot water boilers
- New VMP 2000 vertical flue pipe design boilers
- Electric steam and hot water boilers
- Pulse combustion steam and hot water boilers
- Fuel-fired and electric thermal fluid heaters

Larger blow-down separators are available. Consult factory.

Optional cooling kits available. Cooling kit consist of ball valve, strainer, thermometer and self-actuated valve.

See Fulton VMP Brochure for the 40, 50, 60, 80, 100, 130 and 150 HP Pipe Design and Vertical Boilers.
